Visualisation

Applied Data Science using R, Session 6

Goals for today

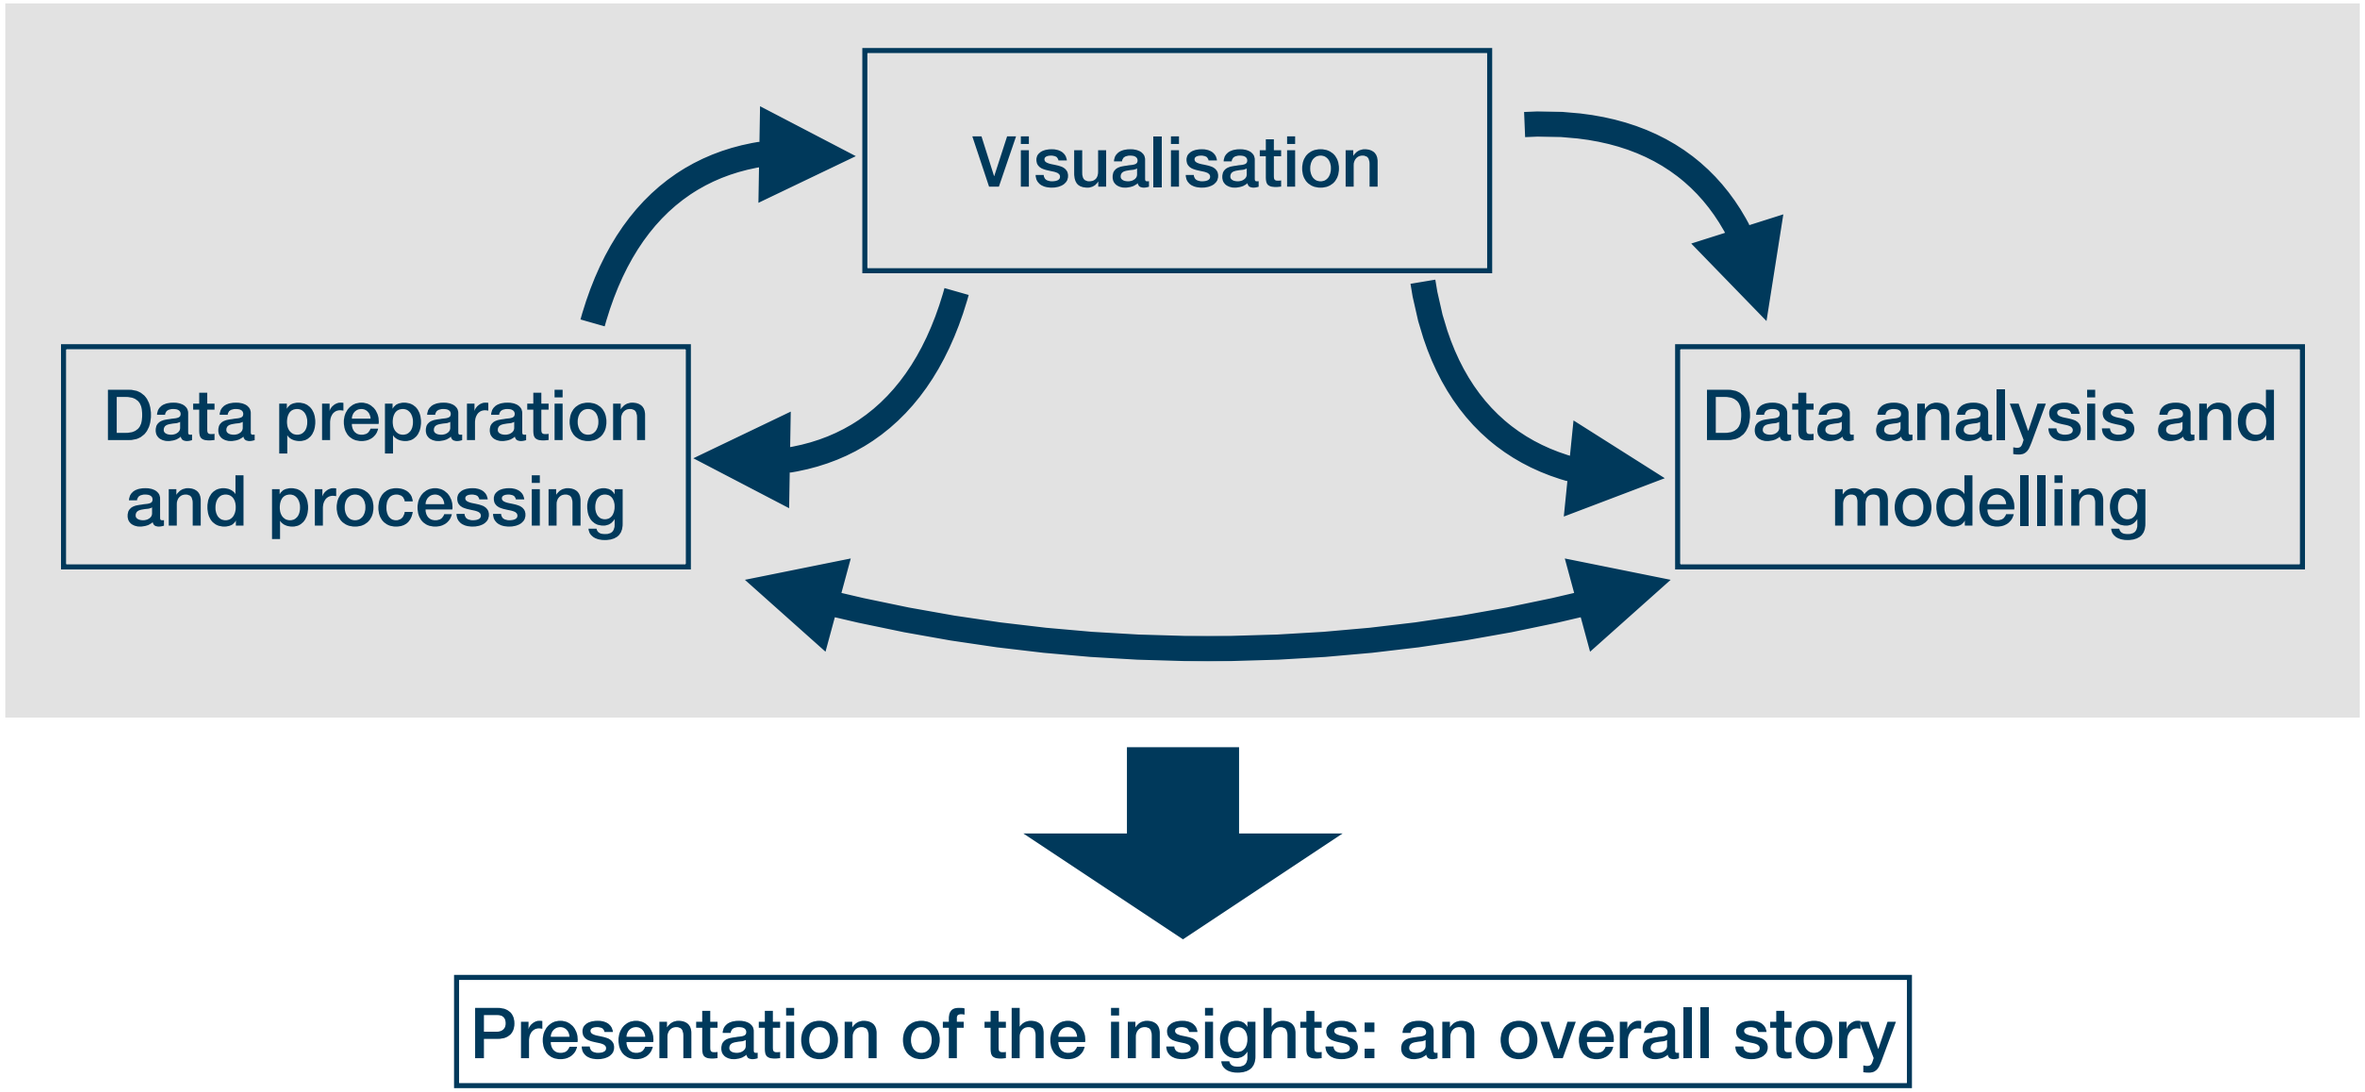
I. Understand how plots are created layer-wise via the `ggplot2` package

II. Learn how to map variables in data frames to visual aspects of a plot

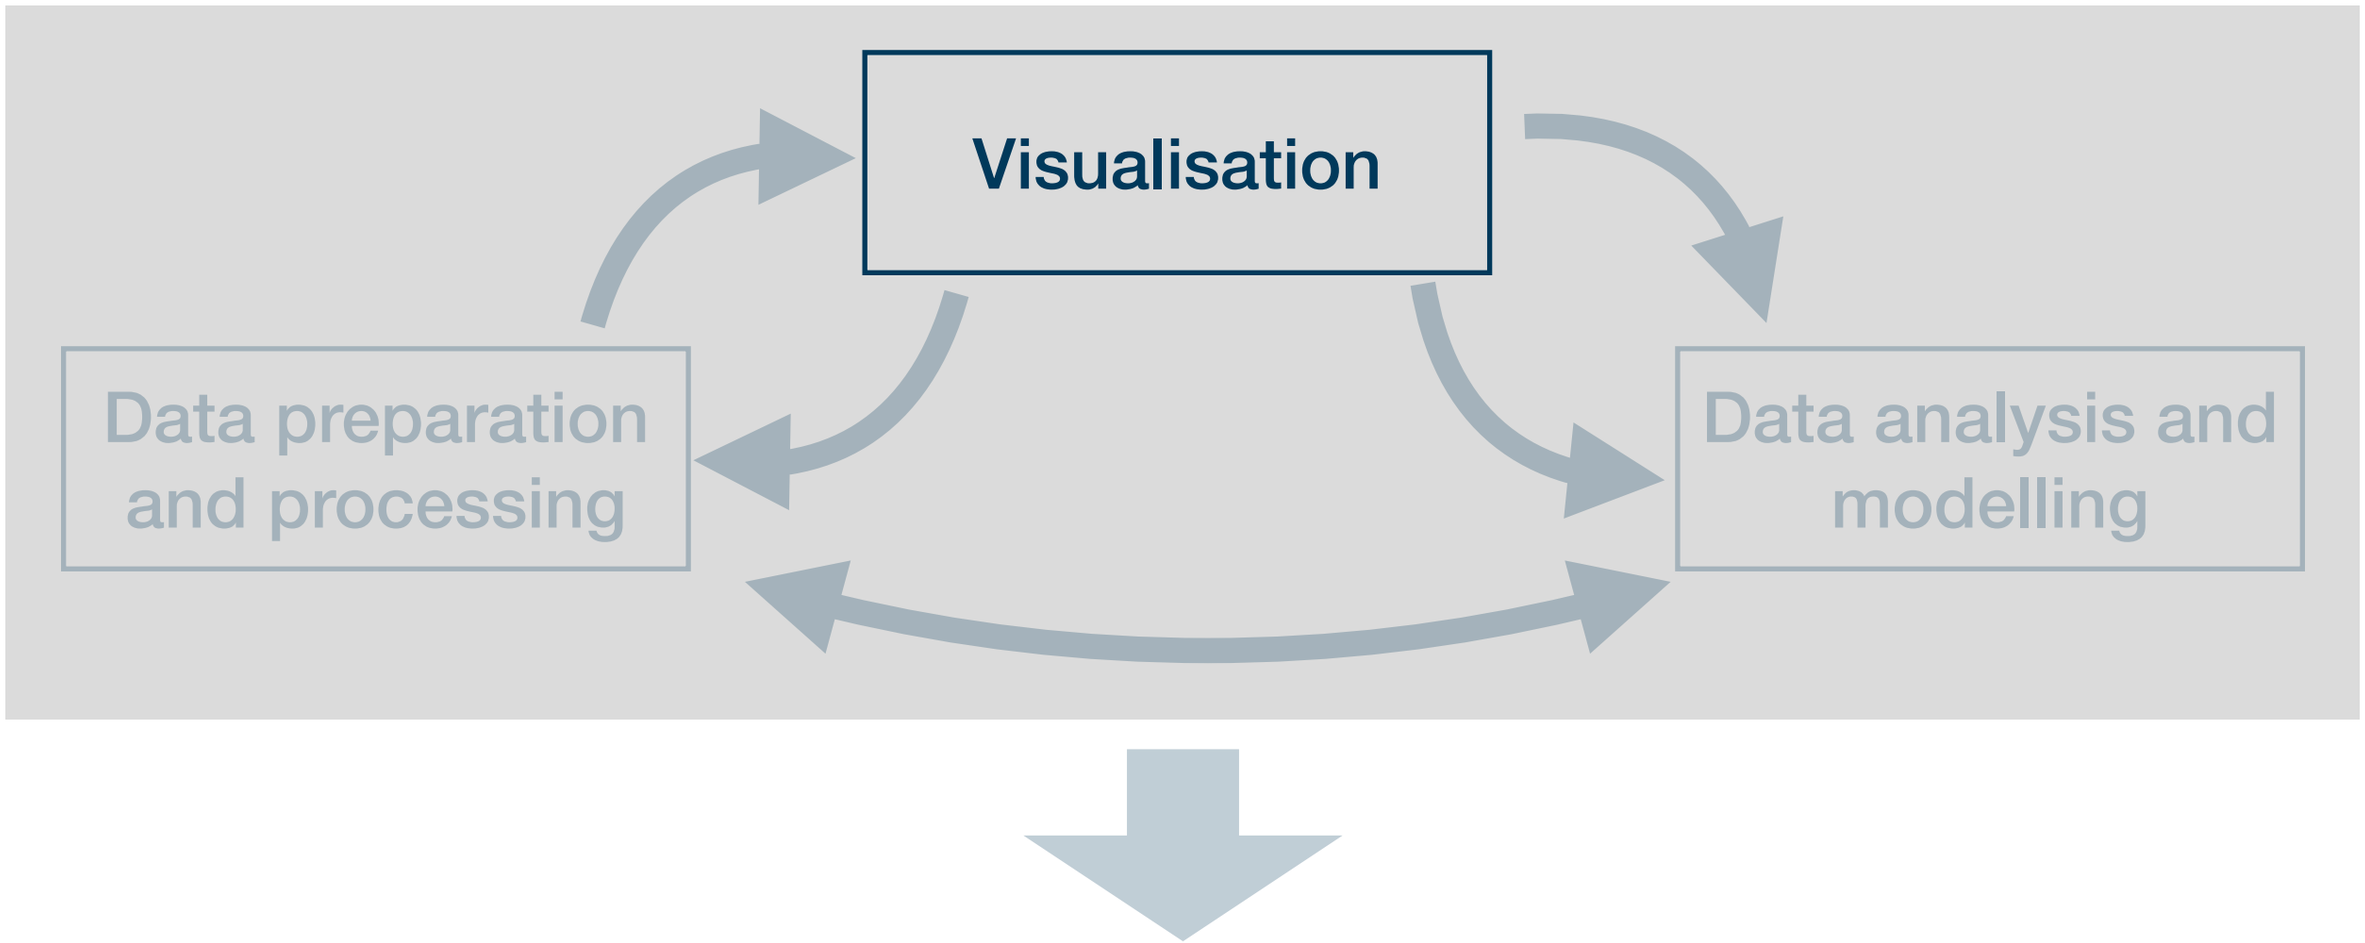
III. Figure out how you can re-use code across different visualisation tasks

Basics of visualization

The role of visualisation in data science



The role of visualisation in data science



Presentation of the insights: an overall story

About visualisations

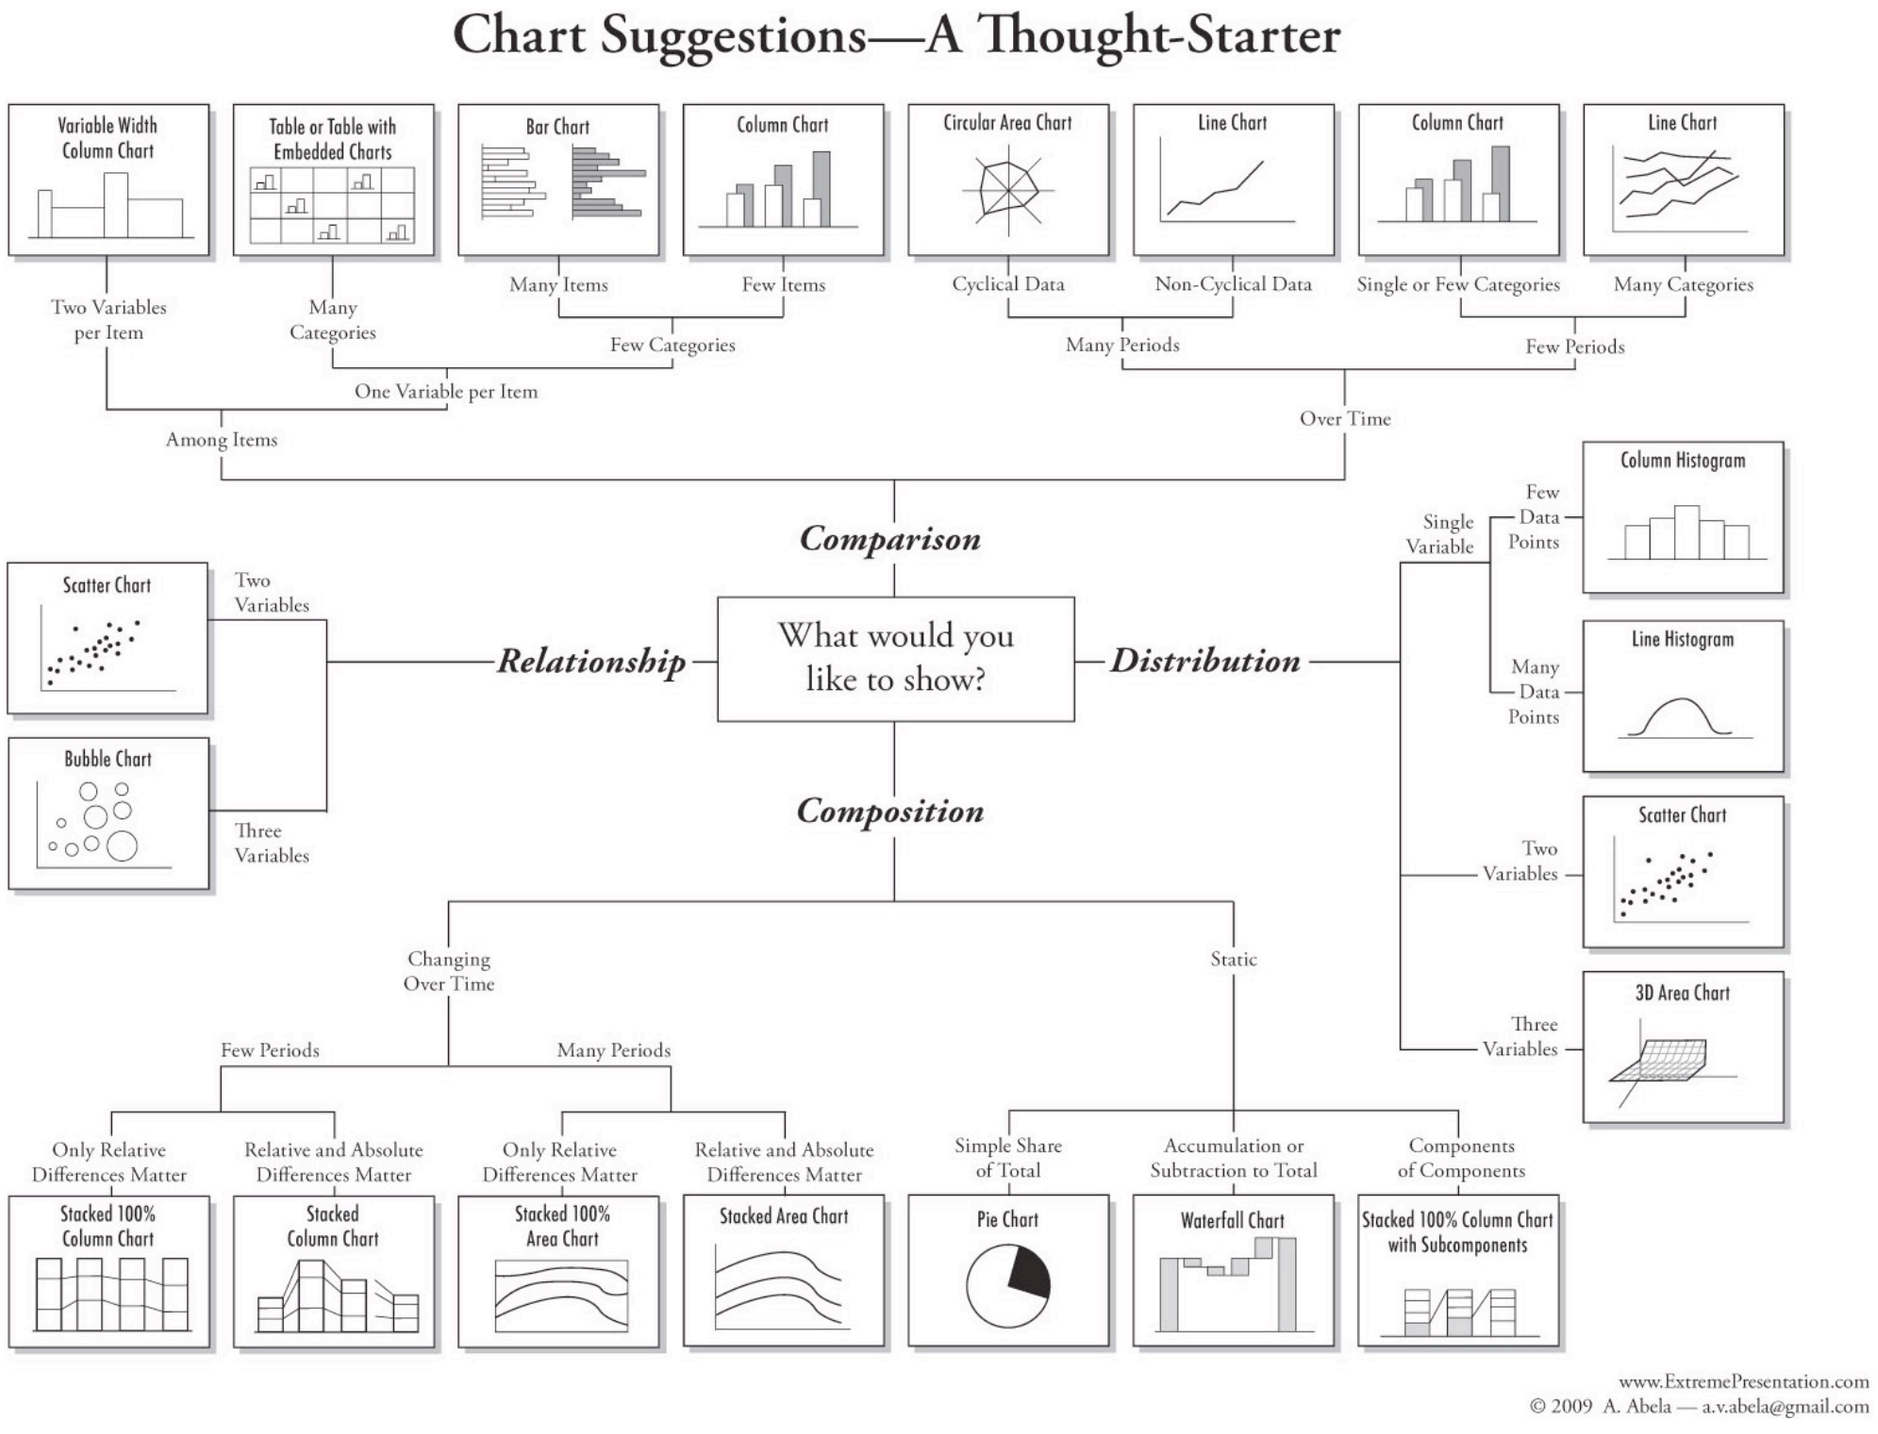
- Visualisations can be used for many purposes
  - Exploratory data analysis → understand your data → prepare/refine models
  - Communication → inform others about your results
  - Manipulation → convince others or recognise others convincing you

- Here we will learn about how to create visualisations using the package **`ggplot2`**

- An easy-to-read, widely-used and powerful visualisation engine

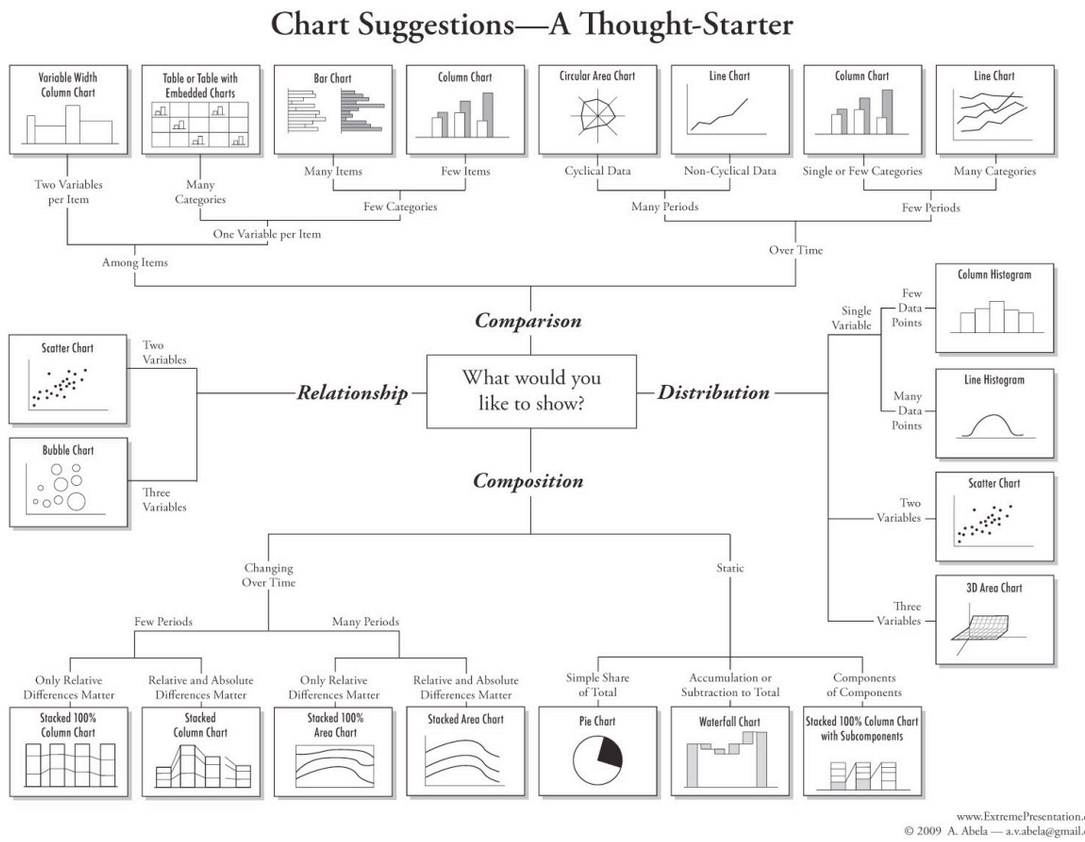
- Many great extensions, e.g. for animated GIFs, control charts, and many more…

What kind of plot do you want?



What kind of plot do you want?

- Visualisation always involves prior thinking and theory
- The great thing about **`ggplot2`** is that the syntax is the same for all graphs
- Once the basic workflow is mastered, it's not difficult to create any of these



- During our lecture we focus on 2 examples:
  - The scatterplot/bubble chart from session 1
  - A line chart

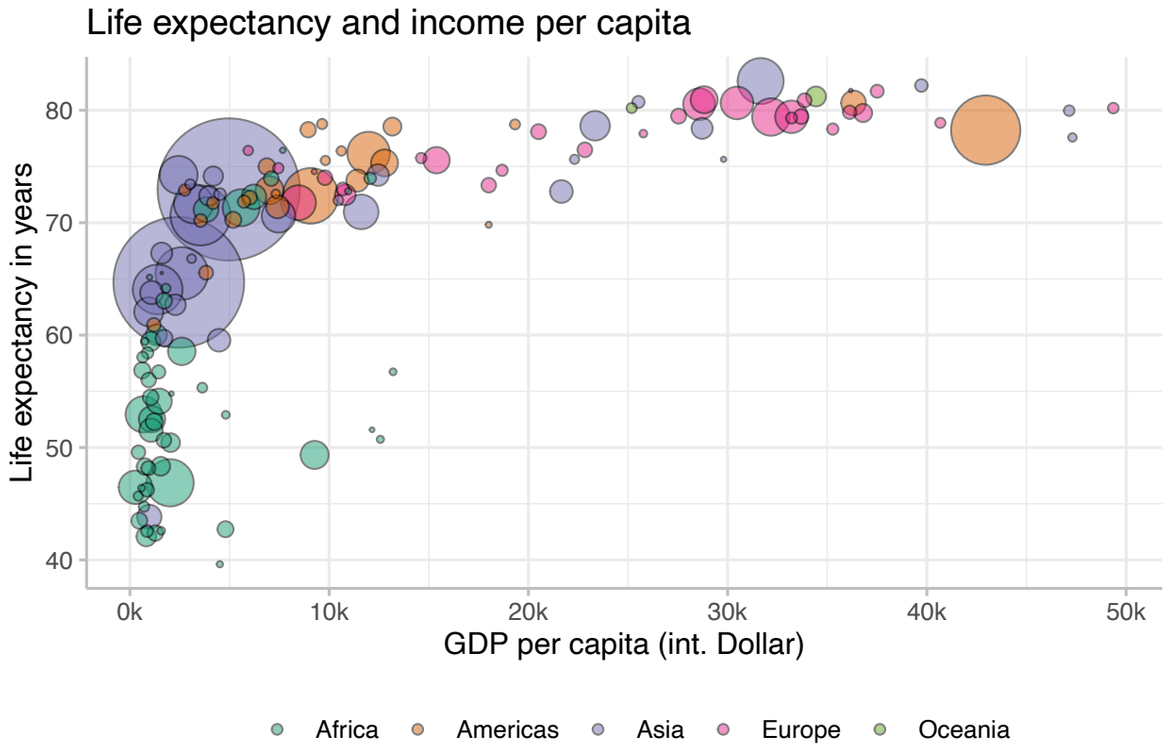
→ Readings provide first generalisation

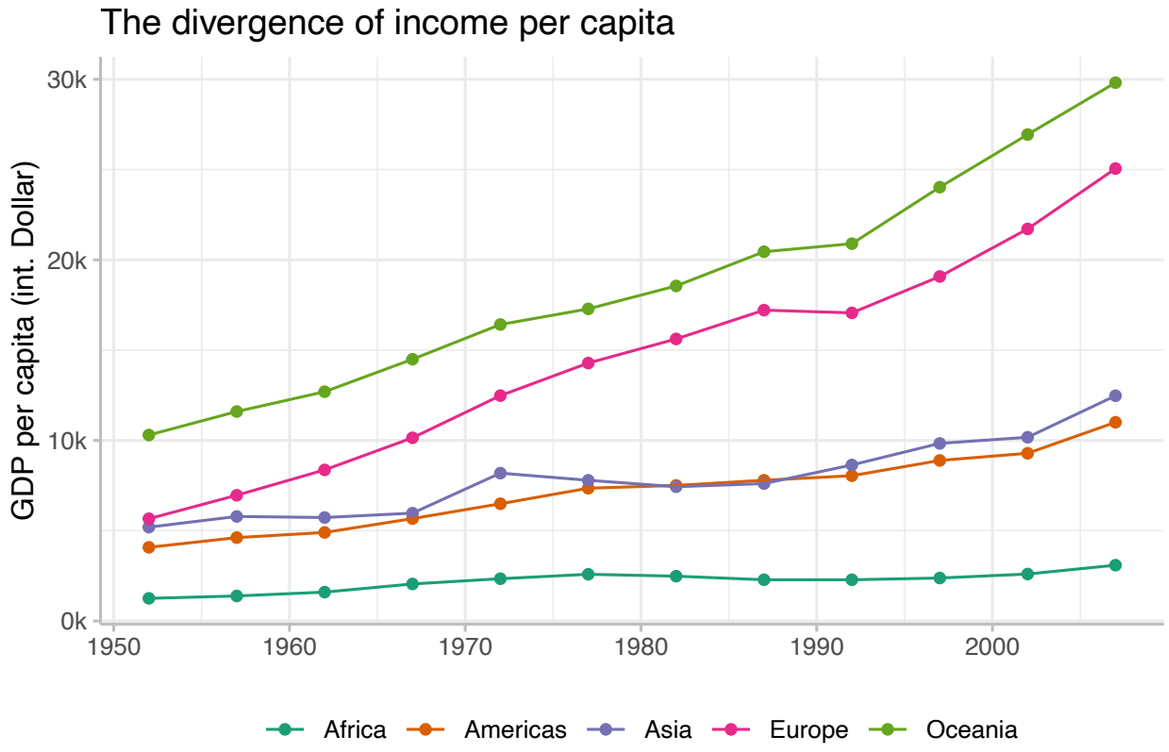
→ Visual fine-tuning in the second visualisation lecture

The practical workflow

Where we want to go:

- Today we want to get started with visualisations and produce the following two plots:





- We will see that the mechanics are very similar for different plots
  - Based on the readings you will be able to make even much more plots already now!

The general idea

- Every plot in **`ggplot2`** is generated in two major steps
  - You describe the plot in all its details via a list
  - You call the list and R renders the plot for you
- To create the list-like description, **`ggplot2`** offers you a ton of helper functions
- You always start with an empty plot, then add layers above this empty plot, adjust details and that's it!
- Lets illustrate this using a subset of the gapminder data set only containing data for the year 2017
  - Readymade available to you via the DataScienceExercises package as **`DataScienceExercises::gdplifexp2007`**

This is where all the work gets done 😅

This is where errors become apparent 🤬

Developing a ggplot - the general workflow

- Since we are working on the graph development interactively, see my **lecture notes** for documentation purposes

Summary & outlook

Summary

- Visualisations serve many purposes, including the exploration of your data and the communication of your results
- We learned how to visualise data stored in data frames via `ggplot2`
- While there are many different plot variants, their syntax is very similar

```
ggplot() +
      <GEOM_FUNCTION>(
        data = <DATA>
        mapping =aes(<MAPPINGS>),
            stat = <STAT>,
            position = <POSITION>
            ) +
      <COORDINATE_FUNCTION> +
      <FACET_FUNCTION> +
      <THEME ADJUSTMENTS>
```

The geometric forms used to represent the data (points, lines, shades,…)

The data to be visualized

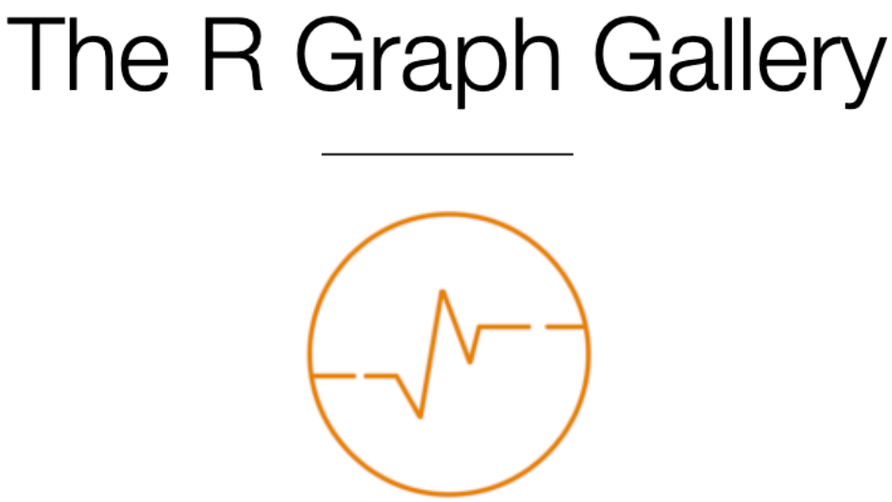
The mapping of the variables in data to the plot aesthetics (x/y-axis, size, form,…)

May be set as defaults within `ggplot()`, or separately for each geom

Adjustment to look, labels, etc.

Summary

- Code for different plots differs mainly by the aesthetic mappings and the geoms used → allows you to re-use a lot of coding heuristics
  - We produced two beautiful plots: a bubble plot and a line graph
- The readings introduce you to other types of plots, which you can easily make more beautiful using the techniques you learned today
- A great way to learn how to plot is to replicate examples from the internet, and adjust them to your own data:



Outlook

- Next session: how to organise an R project and import data into R
  - This allows us in a next step to transform it into a format we can use for visualisation (and, later, modelling)
  - Up till know we only worked with readymade data sets but in reality, the data you get will be messy → learn to produce data as you have already learned use will open many doors

Tasks until next session:

1. Fill in the **quick feedback survey** on Moodle
2. Do the **readings** posted on the course page → they generalise what you have learned to new plot types
3. Have a look at my lecture notes and redo the plot creation of today
4. Do the **exercises** provided on the course page and **discuss problems** and difficulties via the Moodle forum
